

Therapy log

A weekly log of exercises, progress and questions for the next session.

Rehabilitation and therapies

Kind consistency, realistic goals and practice at home.

Types of rehabilitation

Therapy · What it helps with

Physiotherapy / neurorehabilitation — Strength, balance, gait and mobility.

Occupational therapy — Activities of daily living and autonomy.

Speech and language therapy — Communication, voice and swallowing.

Neuropsychology — Memory, attention and executive functions.

Cognitive rehabilitation — Strategies to think and organize better.

Goals and consistency

1. Agree small, measurable goals with the team ("walk 10 meters with support").
2. Spread practice into short, frequent doses rather than exhausting sessions.
3. Record progress and plateaus: plateaus are part of the process, not a failure.
4. Celebrate each achievement and adjust goals with the team.

Your own pace

Recovery is not linear. Good days and harder days coexist; kind consistency yields more than pressure.

Practicing at home

- Do the exercises indicated by the team, without improvising extra ones.
- Weave practice into real routines: dressing, cooking, walking to the yard.
- Mind safety: clear spaces and firm footwear.
